EMBRYO DERIVED PREGNANCY (EDP)

EDP is a service provided by TAG that makes confirmed bovine pregnancies a reality. It uses scientific knowledge and practical experience to help dairy farmers attain hassle-free pregnancy for their cattle.

Simply put, EDP is a combination of Gaubryo and Embryo Transfer Services.

Embryo Transfer Services mean the process of making embryos in the laboratory, outside the body of the cow and eventually transferring these embryos into the uterus of the surrogate cow.

Gaubryo, an exclusive genetic technology by TAG, is a high merit embryo. The embryo is made with the germplasm of high-merit donors and guarantees offspring with superior genetics.

- 100% genetic transmission
- Increased number of offsprings
- Progeny becomes climate resilient
- Higher disease resistance
- Higher feed conversion ratio

Gaubryo can double the milk productivity in just one generation. It increases the chances of the calf being genetically superior. As productivity increases, the cost of production comes down because of higher feed conversion ratio.

Gaubryo comes with assured genetics which will double the income of the dairy farmers.
